

Good thinking

Hot water has the potential to cause injury. Supervision for children is highly recommended.
Not suitable for ages less than 10 years

Step 1: Prepare some hot water. Water just before it starts to boil works well. The Flexi version requires higher temperatures to become soft. Hot water will be dangerous and can cause scalds. (so please be careful)

Step 2: Place your Clever Card in the hot water. The Flexi version requires higher temperatures. With just boiled water it can take between 15 - 30 seconds to melt. The card is molten when you see it go soft. The Flexi version floats and it is hard to see it melt.

Step 3: Remove the molten plastic from the hot water. The Flexi Clever Card rubber can be moulded with TOUGH hands, we recommend the use of basic tools. Unlike our original version, the Flexi version sets quickly so you'll need to create your clever idea a bit faster.

The rubber will begin to set within a minute.

It will be completely set after 1 hour.

The rubber can still be reused 100's of times...

Simply reheat and reshape.

Always be careful
with hot water
